In a world where you can be anything... be kind.

In the vast expanse of space, the Earth is but a tiny speck. Compared to the vastness of the universe, the human race is a mere blip on the radar. Yet, despite this apparent insignificance, our interactions with one another are of utmost importance.

On a global scale, the impact of every person's actions can be felt by others. The kindness and compassion we show towards one another have the potential to ripple outwards, affecting those around us in ways we may never know. Conversely, our negative actions can have the same effect, creating a chain reaction of harm and negativity.

Similarly, our interactions with the world around us have significant consequences. The way we treat the environment, for example, can have far-reaching effects on the planet and all its inhabitants. Our actions can lead to the destruction of ecosystems, the loss of biodiversity, and ultimately, the destabilization of the delicate balance that sustains life on Earth.

Despite our smallness in the grand scheme of things, we have the power to make a difference in the world. By being kind to one another and treating the planet with care and respect, we can create positive change and leave a lasting impact for future generations.

Backdropped against a massive wall of white clouds 130 nautical miles below, astronaut Mark C. Lee floats freely as he tests the new Simplified Aid for EVA Rescue (SAFER) system. The image was exposed with a 35mm camera from the space shuttle Discovery. Astronauts Lee and Carl J. Meade took turns using the SAFER hardware during their shared Extravehicular Activity (EVA) on Sept. 16, 1994, on the STS-64 mission.
